

DocuSign Clone — QA Evaluation Summary

Scaler AI Labs · RL Environments Quality Assurance Pass

Target Viewport: 1280 × 960 (100% Zoom)
Source of Truth: DocuSign Enterprise Free Trial
Date: September 2026

1. OVERALL PRODUCT IMPRESSION

The clone faithfully replicates the macro visual architecture, page hierarchy, and core signing workflows of DocuSign. However, significant fidelity defects exist in form input validation, canvas coordinate clipping, and dynamic state persistence. In an RL training pipeline, these defects would cause autonomous AI agents (such as computer-use models) to encounter severe reward gaming, unhandled exceptions, and invalid pass/fail grader outcomes.

2. TOP 5 BUGS TO FIX FIRST (PRIORITIZED FOR RL STABILITY)

- P1 BUG-001 (Zero-Recipient Envelope Submission Allowed):** The prepare-to-send pipeline permits dispatching envelopes with zero recipients. This introduces severe reward misattribution where RL agent graders falsely mark tasks as complete without establishing communication state.
- P1 BUG-002 (Canvas Field Placement Reset on Page Refresh):** Placed signature and date tags do not persist across browser reloads or route bounces. In multi-step agent trajectories, sudden context reloads discard model progress completely.
- P2 BUG-005 (Tags Dropped Outside PDF Boundaries):** Canvas field placement lacks viewport boundary clipping, allowing drag-and-drop actions to drop tags into unselectable DOM margins outside page boundaries.
- P2 BUG-004 (Malformed Email Strings Accepted Without RFC Validation):** Accepts non-email strings (e.g. plainaddress) without error feedback, corrupting agreement state tables.
- P2 BUG-003 (Seeded Mock Timestamps Static & Contradictory):** Agreement rows render hardcoded timestamps ("14/05/2024") and static badge counts, breaking automated time-dependent grading assertions.

3. TESTING SCOPE & METHODOLOGY

In-Scope Modules Tested: HTTP Basic Auth session lifecycle, Dashboard summary counters, Envelope upload modal, Recipient table CRUD & routing, PDF canvas drag-and-drop tag interactions, Dispatch flow, and Agreements table views (Inbox, Sent, Completed).

Deliberately Skipped (Out-of-Scope): File exports (PDF/CSV/image generation), external third-party integrations (Google Drive, Slack, Notion), and adversarial penetration/security testing as per assignment boundaries.

4. ASSUMPTIONS & UNCONFIRMED SUSPICIONS

- Assumption:** The clone runs as a single-tenant mocked environment where asynchronous email delivery worker queues are intentionally simulated in-memory.
- Unconfirmed Suspicion:** Canvas coordinates for placed signature tags appear hardcoded to standard letter-size aspect ratios, likely failing alignment on landscape or multi-format legal contracts.
